CPSC 481 - Project 2 Report

LLM: NRP-hosted gpt-oss

1. Why did you choose the particular LLM?

I chose the NRP-hosted gpt-oss model because it was recommended by the instructor and accessible through the provided API key. Its OpenAI-compatible API allowed me to use it without installing a local model or purchasing API credits.

2. The major challenge in completing your project

The main challenge was writing a prompt that clearly described the complete Bayesian network and correctly handled unknown evidence. I also needed the model to return only valid JSON so that my code could reliably extract the disease and probability.

3. Something surprising you learned about LLMs from this project

I was surprised that an LLM could use probability tables described in plain text to produce results closely matching exact Bayesian inference. However, valid JSON does not guarantee correct calculations, so comparing its answers with Project 1 remains important.
